Note (1): Measuring Conditions

The optical characteristics are determined after the unit has been 'ON' and stable at the maximum brightness, in a dark environment at an ambient temperature at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$. The electrical conditions include $V_{\text{CCS}} = 3.3 \text{ V}$, $f_v = 60 \text{ Hz}$, $f_{\text{CLK}} = 100 \text{ MHz}$, $I_{\text{LED}} = 20.0 \text{ mA}$. Recommended measuring equipments for luminance and color is Photo Research PR650 Colorimeter or similar. The measuring distance should be about 30-50 cm from the LCD surface at normal unless otherwise specified. The (virtual) measuring spot should be 5mm in diameter. The CIE 1931 and 1967 Standards shall be used. Measurements should be done on the 160 grid points as shown in the following figures. Viewing angle measurements should be done by an Eldim EZ Color system or similar. Measurement data needs to be calibrated to Apple's equipment measurement results.

Note (2): Optical Measurement Set-up

Center Point Luminance

L_{ct} = Average luminance at point # 72, 73, 88, 89 point of the display

Average Luminance

$L_{Ave} = \text{SUM}(L1:L160) / 160$ where L1 to L160 are the luminance values measured at point #1 to #160.

6 Points Color Gradient measurement point location.

Global Luminance Uniformity:

$UL = 100\% - (L_{max} - L_{min}) / L_{max}$ where, $L_{max} = \max \{\text{Luminance values at 160 points}\}$,

$L_{min} = \min \{\text{Luminance values at 160 points}\}$

Worst Neighbor Luminance Uniformity

(The 4 points that are closest to the test point) $WNU_L = 100\% - \max(\Delta L1, \Delta L2, \Delta L3, \Delta L4) / L0$

Global WNU = $\min (WNU1, \dots, WNU160)$

Contrast Ratio

CR = Luminance at White / Luminance at Black.

RGB Color Chromaticity

The entire display active area shall be scanned with the color coordinate measurement with screen set to full brightness and solid R, G, B color respectively. The measured color coordinate of any panel shall be within the box with 4 corners

Viewing Angle

The viewing angle is defined as the viewing angle range under the condition at CR > 100:1 .

Response Time

The On/Off response time, $\tau_R + \tau_F$, is defined in the following figure and shall be measured by switching the input signal for “black” and “white”.

Gray to Gray Response Time is measured in a similar method. But instead of switching display between black and white, panel is switched between two gray scales. The maximum gray-to-gray response time is based on 9 levels of gray scales. The 9 levels are: gray level 255, 223, 191, 159, 127, 95, 63, 32 and 0.

Gray Scale Linearity or Gamma Value

The display luminance, L_G , is measured at the different gray scales, G_{min}, \dots, G_{max} . The exponential fitting is used to determine the gamma (γ) value, which should be an intrinsic or uncorrected characteristic.

$$L_G \sim G^\gamma.$$

Flicker

No visual flicker will be allowed. The flicker level should be measured on GS223, GS191, GS159, GS127, GS95, GS63, GS31. The output signal of a photometer is sent to an FFT analyzer. The flicker is essentially a ratio of the powers in the frequency spectrum at 30 Hz (P_x) and 0 Hz (P_0), i.e., $F = 10 \text{ Log} (P_x / P_0)$.

Cross-Talk

No visual cross-talk will be allowed. Two luminance values are measured at center spot with 50 x 50 pixels. The cross-talk, D_{SHA} , is defined as, $D_{SHA} = (L_B - L_A) / L_B \cdot 100\%$, Where, L_A = Luminance in Pattern A L_B = Luminance in Pattern B.

Pattern A

Gray Scale = 127/255
Black in surrounding

Pattern B

Gray Scale = 127/255
full screen

Note (3): Measured at center point. Equivalent performance over the entire panel required.

Note (4): Both center point luminance and average luminance of 160 points.

Note (5): All 160 points measurement required.

8. PRECAUTIONS

8.1 HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the LED wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

8.2 STORAGE PRECAUTIONS

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly.

8.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the CMOS LSI chips from damage during latch-up.
- (3) Do not disassemble the module or insert anything into the Backlight unit.
